

A short reflection (6 - 7 sentences) explaining:

- Which design was easiest?
- What branding elements were applied?
- How do you ensure readability and hierarchy?
- What you learned about creating social media graphics.

The easiest design for me to create was the GitHub banner because I had access to design tools and references that helped guide the layout and overall structure. I applied branding elements, including my logo, the GitHub icon, and my core technology stacks, to represent my identity in the IT field. A complementary blue-and-orange color scheme was used to create visual balance and maintain a professional yet creative look. Readability and hierarchy were ensured by centering important elements, using consistent font sizes, and arranging content from most important to least important. Proper spacing and contrast between text and background also improved clarity. Through this process, I learned that creating effective social media graphics requires simplicity, consistency, and clear visual hierarchy. Overall, thoughtful design choices make content more engaging and easier for viewers to understand.
