

- Short write-up (5 - 7 sentences) explaining:
 - The purpose of your app.
 - Target users
 - Why did you choose your layout and colors
 - Challenges faced
 - Improvements you'd make with more time

So one of the creations I made in this app is a Pomodoro timer that could be built on a basic front-end website. The purpose of this app is for people who are into pomodoro study or for students who are studying, which tracks the time they are working, the work or assignment they are doing, and, lastly, focuses on their studies while doing assignments on their own. I chose a simple layout, colors such as squares, and a simple font for the website, adding simplicity to the app, and I chose the red color and made sure that the background color of every color in the app is readable with the fonts and simple. Some challenges I faced were mostly adding functionality to the UI/UX prototype. I didn't put effort into creating the start timer for the home, since I only ensured that the output would be presented when it was possible to code on the front-end. If I were given time to make improvements in these UI/UX frames, I would definitely add more features to the study and reports, such as graphs and a report system, tracking the work of the account, and additionally adding a user account interface for users when using this app. It is possible to add features from the start, but the app's purpose is open source, simple, and for everyone to use.
